PART R08
REINSTATEMENT OF EXISTING PAVEMENTS

CONTENTS

1. GENERAL
2. CONSTRUCTION OF PAVEMENT
3. SHOULDERS
4. UNBOUND AND CEMENT TREATED PAVEMENTS
5. TEMPORARY PAVEMENT SURFACE
6. SURFACING - GENERAL
7. ASPHALT SURFACING
8. JOINT SEALING
9. SPRAYED BITUMINOUS SURFACING
10. REINSTATEMENT OF OTHER INFRASTRUCTURE
11. ATTACHMENT R08A MINIMUM SURFACING REINSTATEMENT REQUIREMENTS

1. GENERAL

.1 This Part specifies the requirements for the reinstatement of an existing pavement above an excavation carried out for purposes such as the installation, maintenance or inspection of culverts, drainage structures, pits, cables, conduits and pipes.

2. CONSTRUCTION OF PAVEMENT

.1 Unless specified otherwise, reinstatement of an existing pavement shall be undertaken in accordance with the applicable figure specified in the "Pavement Reinstatement Configurations", available from:

.2 Notwithstanding the above requirement, a reinstated pavement shall not be of a lesser standard and thickness than the existing pavement.

.3 The supply of pavement materials shall comply with Part R15 Pavement Materials.

3. SHOULDERS

.1 The reinstatement of unsealed shoulders shall match finished shoulder level and existing crossfall.

.2 Sealed shoulders shall be resealed with materials matching the original surface.

.3 If traffic is diverted onto the road shoulder as part of traffic management, the shoulder shall be returned to the condition that existed prior to the Works taking place.

4. UNBOUND AND CEMENT TREATED PAVEMENTS

.1 Unbound granular pavement layers shall be uniformly compacted in horizontal layers not exceeding 200 mm thickness (loose).

.2 Specified compaction shall be determined using AS 1289, test method 5.2.1 (modified compaction) and tested at the frequency specified in Table 4.2.

<table>
<thead>
<tr>

<td>0 - 25 m²</td>
</tr>
<tr>
<td>one test per layer</td>
</tr>
<tr>
<td>25 - 100 m²</td>
</tr>
<tr>
<td>minimum 2 tests per layer</td>
</tr>
<tr>
<td>over 100 m²</td>
</tr>
<tr>
<td>2 tests per layer and an additional test per layer for every 100 m² or part thereof over 100 m²</td>
</tr>
</tbody>
</table>

.3 Cement treated pavements shall comply with Part R22.

5. TEMPORARY PAVEMENT SURFACE

.1 The open surface of any pavement layer shall be maintained to prevent deterioration and the ingress of water prior to the application of the final surfacing.
Effective: July 2018
Specification: Part R08 Pavement Reinstatement

.2 In the event that the reinstatement and / or surrounding pavement layers become affected by the ingress of water prior to the application of final surfacing, all affected material shall be removed and replaced with conforming material.

.3 If the final surfacing is not placed before the reinstatement is opened to traffic, a temporary asphalt or bituminous surface, similar to that previously existing, shall be provided and maintained in a safe and trafficable condition for all road users, including cyclists and pedestrians.

.4 Where asphalt is used as the temporary surface, the minimum depth of asphalt shall be 50 mm.

6. SURFACING - GENERAL

.1 The supply and placing of the surfacing shall be undertaken in accordance with the requirements of the applicable figure in the Pavement Reinstatement Configurations document.

.2 Unless approved otherwise in writing, the final surfacing shall extend:
   - For a transverse Trench: Not less than that shown in Attachment R08A.
   - For a longitudinal Trench: Full lane width.

.3 The joint between the existing and reinstated final surfacing shall not be positioned within the wheel path.

7. ASPHALT SURFACING

.1 The final wearing course of the reinstatement of asphalt surfaced pavements shall be extended beyond the sides of the Trench by cold planning and reinstating to a minimum depth of 50 mm.

.2 Unless approved otherwise in writing, the wearing course shall be laid with a paver. Within the DPTI Metropolitan Region, the wearing course shall contain polymer modified binder.

.3 Asphalt layers, including the final surfacing, shall comply with the quality requirements, level tolerances and surface irregularity acceptance criteria of Part R27 “Supply of Asphalt” and Part R28 “Construction of Asphalt Pavements”, except that the frequency of sampling and testing shall be in accordance with Table 6.6.

</tr>
<tr>
<td>&gt; 300 tonnes</td>
</tr>
</tbody>
</table>

.4 The asphalt mix shall be registered with DPTI in accordance with Part R27 and be identified as such on cartnotes.

.5 Attention is drawn to Clause 6.4 “Tack Coating” of Part R28 which requires tack coating to be applied to vertical edges between old and new asphalt pavements. On completion of reinstatement, any residual saw cuts shall be sealed to prevent water ingress into the pavement in accordance with Clause 6.3 “Joint Sealing”.

8. JOINT SEALING

.1 The joint sealing compound shall:
   - (a) be Class 170 bitumen to AS 2008 "Residual Bitumen for Pavements", modified with an appropriate polymer;
   - (b) be designed to penetrate the joint or saw cut, adhere to the surface and resist crack propagation; and
   - (c) remain stable on the pavement surface during periods of extreme temperature and shall be approved in accordance with Part R37 “Pavement Crack Sealing” prior to use.

.2 The grit shall comply with Sealing Aggregate SA5-2.

.3 Prior to placement of sealant, joints or saw cuts shall be thoroughly cleaned of foreign material, without damage to the adjoining sound pavement, to provide a clean, dry environment.
.4 If the pavement is damp, warm/hot compressed air may be used to dry of the surface of the joints or saw cut.

.5 Sealing shall not be undertaken unless the surfaces that the sealant will be applied to are dry.

.6 Joints and saw cuts shall be cleaned to a minimum depth 15 mm.

.7 In excessively deep cuts, the void may be plugged with grit to within 15 mm of the pavement surface.

.8 All voids shall be filled with sealant material to a level of not less than 15 mm below the pavement surface.

.9 The level of sealant after gritting shall be flush with the adjoining road pavement.

.10 The width of the visible bond on the pavement surface shall be as narrow as practical.

.11 The sealant shall not run out over the pavement surface beyond the extent of the joint or saw cut.

.12 Grit shall be placed on the surface of all sealant while it is sufficiently hot for the grit to adhere to the sealant.

.13 Grit shall be placed at the minimum application necessary to provide adequate skid resistance and prevent pick-up of the sealant by traffic.

9. SPRAYED BITUMINOUS SURFACING

.1 The reinstatement of sprayed bituminous surfacing shall be undertaken in accordance with the requirements of Part R26 Application of Sprayed Bituminous Surfacing.

.2 Sprayed bituminous surfacing shall comprise of a primerseal and sprayed bituminous surfacing, with the surfacing placed not less than 48 hours after the primerseal has been placed.

.3 The surfacing shall match the size and texture of the existing adjacent road and be finished off evenly and flush with the adjoining pavement surface.

.4 The resultant surfacing shall be within the tolerance of 15 mm as measured by a 3 m straight edge in any direction.

10. REINSTATEMENT OF OTHER INFRASTRUCTURE

.1 All pavement marking, road furniture, drainage systems, secondary paving and similar infrastructure which has been removed or damaged during the excavation and reinstatement work shall be replaced to the standard matching the existing and in accordance with the relevant parts of the DPTI Master Specification as listed in Table 10.

<table>
